Chapter 1

Introduction

This document is a technical reference to the in-EVM Mina state verification project.

1.1 Overview

The project's purpose is to provide Ethereum users with reliable Mina Protocol's state proof. The project UX consists of several steps:

1. Retrieve Mina Protocol's state proof.
2. Preprocess it by generating an auxiliary proof.
3. Submit the preprocessed proof to EVM-enabled cluster.
4. Verify the proof with EVM.

Such a UX defines projects parts:

1. Mina Protocol's state retriever (O(1) Labs' or Chainsafe's protocol implementation).
2. State proof generator.
3. Ethereum RPC proof submitter.
4. EVM-based proof verifier.

The overall architecture diagram is as follows:

Each of these parts will be considered independently.

Chapter 2

State Proof Generator

This introduces a description for Mina Protocol’s state auxiliary proof generator. Crucial components which define this part design and performance are:

1. Input data format (Pickles proof data structure: [2.2.2](#))
2. Proof system used for the proof generation.
3. Circuit definition used for the proof system.

2.1 Introduction

To prove Mina blockchain’s state on the Ethereum Virtual Machine, we use Redshift SNARK[1]. RedShift is a transparent SNARK that uses PLONK[2] proof system but replaces the commitment scheme. The authors utilize FRI[3] protocol to obtain transparency for the PLONK system.

However, FRI cannot be straightforwardly used with the PLONK system. To achieve the required security level without huge overheads, the authors introduce *list polynomial commitment* scheme as a part of the protocol. For more details, we refer the reader to [1].

The original RedShift protocol utilizes the classic PLONK[2] system. To provide better performance, we generalize the original protocol for use with PLONK with custom gates [4], [5] and lookup arguments [6], [7].¹

2.2 Mina Verification Algorithm

WIP

2.2.1 Pasta Curves

Let $n_1 = 17$, $n_2 = 16$. Pasta curves parameters:

- $p = 2^{254} + 45560315531419706090280762371685220353$
- $q = 2^{254} + 45560315531506369815346746415080538113$
- Pallas:

$$\mathbb{G}_1 = \{(x, y) \in \mathbb{F}_p \mid y^2 = x^3 + 5\}$$
$$|\mathbb{G}_1| = q$$

- Vesta:

$$\mathbb{G}_2 = \{(x, y) \in \mathbb{F}_q \mid y^2 = x^3 + 5\}$$
$$|\mathbb{G}_2| = p$$

¹Details on the proof system: https://github.com/NilFoundation/evm-mina-verification/tree/master/docs/proof_system

2.2.2 Verification Algorithm

Notations

N_{wires}	Number of wires ('advice columns')
N_{perm}	Number of wires that are included in the permutation argument
N_{prev}	Number of previous challenges
$S_{\sigma_i}(X)$	Permutation polynomials for $0 \leq i < N_{\text{perm}}$
$pub(X)$	Public input polynomial
$w_i(X)$	Witness polynomials for $0 \leq i < N_{\text{wires}}$
$\eta_i(X)$	Previous challenges polynomials for $0 \leq i < N_{\text{prev}}$
ω	n -th root of unity

Denote multi-scalar multiplication $\sum_{s_i \in \mathbf{s}, G_i \in \mathbf{G}} [s_i]G_i$ by $\text{MSM}(\mathbf{s}, \mathbf{G})$ for $l_{\mathbf{s}} = l_{\mathbf{G}}$ where $l_{\mathbf{s}} = |\mathbf{s}|$, $l_{\mathbf{G}} = |\mathbf{G}|$. If $l_{\mathbf{s}} < l_{\mathbf{G}}$, then we use only first $l_{\mathbf{s}}$ elements of \mathbf{G}

Proof π contains (here \mathbb{F}_r is a scalar field of \mathbb{G}):

- Commitments:
 - Witness polynomials: $w_{0,\text{comm}}, \dots, w_{N_{\text{wires}},\text{comm}} \in \mathbb{G}$
 - Permutation polynomial: $z_{\text{comm}} \in \mathbb{G}$
 - Quotient polynomial: $t_{\text{comm}} = (t_{1,\text{comm}}, t_{2,\text{comm}}, \dots, t_{N_{\text{perm}},\text{comm}}) \in (\mathbb{G}^{N_{\text{perm}}} \times \mathbb{G})$
- Evaluations:
 - $w_0(\zeta), \dots, w_{N_{\text{wires}}}(\zeta) \in \mathbb{F}_r$
 - $w_0(\zeta\omega), \dots, w_{N_{\text{wires}}}(\zeta\omega) \in \mathbb{F}_r$
 - $z(\zeta), z(\zeta\omega) \in \mathbb{F}_r$
 - $S_{\sigma_0}(\zeta), \dots, S_{\sigma_{N_{\text{perm}}}}(\zeta) \in \mathbb{F}_r$
 - $S_{\sigma_0}(\zeta\omega), \dots, S_{\sigma_{N_{\text{perm}}}}(\zeta\omega) \in \mathbb{F}_r$
 - $\bar{L}(\zeta\omega) \in \mathbb{F}_r$ ²
- Opening proof o_{π} for inner product argument:
 - $(L_i, R_i) \in \mathbb{G} \times \mathbb{G}$ for $0 \leq i < \text{lr_rounds}$
 - $\delta, \hat{G} \in \mathbb{G}$
 - $z_1, z_2 \in \mathbb{F}_r$
- previous challenges:
 - $\{\eta_i(\xi_j)\}_j, \eta_{i,\text{comm}}$, for $0 \leq i < \text{prev}$

Remark: For simplicity, we do not use distinct proofs index i for each element in the algorithm below. For instance, we write pub_{comm} instead of $pub_{i,\text{comm}}$.

Algorithm 1 Verification

Input: $\pi_0, \dots, \pi_{\text{batch_size}}$ (see 2.2.2)**Output:** acc or rej

1. for each π_i :
 - 1.1 $\text{pub}_{\text{comm}} = \text{MSM}(\mathbf{L}, \text{pub}) \in \mathbb{G}$, where \mathbf{L} is Lagrange bases vector
 - 1.2 **random_oracle**(p_{comm}, π_i):
 - 1.2.1 $H_{\mathbb{F}_q}.\text{absorb}(\text{pub}_{\text{comm}} || w_{0,\text{comm}} || \dots || w_{N_{\text{wires}},\text{comm}})$
 - 1.2.2 $\beta, \gamma = H_{\mathbb{F}_q}.\text{squeeze}()$
 - 1.2.3 $H_{\mathbb{F}_q}.\text{absorb}(z_{\text{comm}})$
 - 1.2.4 $\alpha = \phi(H_{\mathbb{F}_q}.\text{squeeze}())$
 - 1.2.5 $H_{\mathbb{F}_q}.\text{absorb}(t_{1,\text{comm}} || \dots || t_{N_{\text{perm}},\text{comm}} || \dots || \infty ||)$
 - 1.2.6 $\zeta = \phi(H_{\mathbb{F}_q}.\text{squeeze}())$
 - 1.2.7 Transform $H_{\mathbb{F}_q}$ to $H_{\mathbb{F}_r}$
 - 1.2.8 $H_{\mathbb{F}_r}.\text{absorb}(\text{pub}(\zeta) || w_0(\zeta) || \dots || w_{N_{\text{wires}}}(\zeta) || S_0(\zeta) || \dots || S_{N_{\text{perm}}}(\zeta))$
 - 1.2.9 $H_{\mathbb{F}_r}.\text{absorb}(\text{pub}(\zeta\omega) || w_0(\zeta\omega) || \dots || w_{N_{\text{wires}}}(\zeta\omega) || S_0(\zeta\omega) || \dots || S_{N_{\text{perm}}}(\zeta\omega))$
 - 1.2.10 $H_{\mathbb{F}_r}.\text{absorb}(\bar{L}(\zeta\omega))$
 - 1.2.11 $v = \phi(H_{\mathbb{F}_r}.\text{squeeze}())$
 - 1.2.12 $u = \phi(H_{\mathbb{F}_r}.\text{squeeze}())$
 - 1.2.13 Compute evaluation of $\eta_i(\zeta), \eta_i(\zeta\omega)$ for $0 \leq i < N_{\text{prev}}$
 - 1.2.14 Compute evaluation of $\bar{L}(\zeta)$
 - 1.3 $\mathbf{f}_{\text{base}} := \{S_{\sigma_{N_{\text{perm}}-1},\text{comm}}, \text{gate}_{\text{mult},\text{comm}}, w_{0,\text{comm}}, w_{1,\text{comm}}, w_{2,\text{comm}}, q_{\text{const},\text{comm}}, \text{gate}_{\text{psdn},\text{comm}}, \text{gate}_{\text{rc},\text{comm}}, \text{gate}_{\text{ec_add},\text{comm}}, \text{gate}_{\text{ec_dbl},\text{comm}}, \text{gate}_{\text{ec_endo},\text{comm}}, \text{gate}_{\text{ec_vbase},\text{comm}}\}$
 - 1.4 $s_{\text{perm}} := (w_0(\zeta) + \gamma + \beta \cdot S_{\sigma_0}(\zeta)) \cdot \dots \cdot (w_5(\zeta) + \gamma + \beta \cdot S_{\sigma_{N_{\text{perm}}}}(\zeta))$
 - 1.5 $\mathbf{f}_{\text{scalars}} := \{-z(\zeta\omega) \cdot \beta \cdot \alpha_0 \cdot zkp(\zeta) \cdot s_{\text{perm}}, w_0(\zeta) \cdot w_1(\zeta), w_0(\zeta), w_1(\zeta), 1, s_{\text{psdn}}, s_{\text{rc}}, s_{\text{ec_add}}, s_{\text{ec_dbl}}, s_{\text{ec_endo}}, s_{\text{ec_vbase}}\}$
 - 1.6 $f_{\text{comm}} = \text{MSM}(\mathbf{f}_{\text{base}}, \mathbf{f}_{\text{scalars}})$
 - 1.7 $\bar{L}_{\text{comm}} = f_{\text{comm}} - t_{\text{comm}} \cdot (\zeta^n - 1)$
 - 1.8 **PE** is a set of elements of the form $(f_{\text{comm}}, f(\zeta), f(\zeta\omega))$ for the following polynomials:
 $\eta_0, \dots, \eta_{N_{\text{prev}}}, \text{pub}, w_0, \dots, w_{N_{\text{wires}}}, z, S_{\sigma_0}, \dots, S_{\sigma_{N_{\text{perm}}}}, \bar{L}$
 - 1.9 $\mathcal{P}_i = \{H_{\mathbb{F}_q}, \zeta, v, u, \mathbf{PE}, o_{\pi_i}\}$
 2. **final_check**($\mathcal{P}_0, \dots, \mathcal{P}_{\text{batch_size}}$)
-

Algorithm 2 Final Check

Input: $\pi_0, \dots, \pi_{\text{batch_size}}$, where $\pi_i = \{H_{i, \mathbb{F}_q}, \zeta_i, \zeta_i \omega, v_i, u_i, \mathbf{PE}_i, o_{\pi_i}\}$ **Output:** acc or rej

1. $\rho_1 \rightarrow \mathbb{F}_r$
 2. $\rho_2 \rightarrow \mathbb{F}_r$
 3. $r_0 = r'_0 = 1$
 4. for $0 \leq i < \text{batch_size}$:
 - 4.1 $\text{cip}_i = \text{combined_inner_product}(\zeta_i, \zeta_i \omega, v_i, u_i, \mathbf{PE}_i)$
 - 4.2 $H_{i, \mathbb{F}_q}.\text{absorb}(\text{cip}_i - 2^{255})$
 - 4.3 $U_i = (H_{i, \mathbb{F}_q}.\text{squeeze}()).\text{to_group}()$
 - 4.4 Calculate opening challenges $\xi_{i,j}$ from o_{π_i}
 - 4.5 $h_i(X) := \prod_{k=0}^{\log(d+1)-1} (1 + \xi_{\log(d+1)-k} X^{2^k})$, where $d = \text{lr_rounds}$
 - 4.6 $b_i = h_i(\zeta) + u_i \cdot h_i(\zeta \omega)$
 - 4.7 $C_i = \sum_j v_i^j (\sum_k r_i^k f_{j, \text{comm}})$, where $f_{j, \text{comm}}$ from \mathbf{PE}_i .
 - 4.8 $Q_i = \sum (\xi_{i,j} \cdot L_{i,j} + \xi_{i,j}^{-1} \cdot R_j) + \text{cip}_i \cdot U_i + C_i$
 - 4.9 $c_i = \phi(H_{i, \mathbb{F}_q}.\text{squeeze}())$
 - 4.10 $r_i = r_{i-1} \cdot \rho_1$
 - 4.11 $r'_i = r'_{i-1} \cdot \rho_2$
 - 4.12 Check $\hat{G}_i = \langle s, G \rangle$, where s is set of $h(X)$ coefficients.
Remark: This check can be done inside the MSM below using r'_i .
 5. $\text{res} = \sum_i r_i (c_i Q_i + \text{delta}_i - (z_{i,1}(\hat{G}_i + b_i U_i) + z_{i,2} H))$
 6. return $\text{res} == 0$
-

Algorithm 3 Combined Inner Product

Input: $\xi, r, f_0(\zeta_1), \dots, f_k(\zeta_1), f_0(\zeta_2), \dots, f_k(\zeta_2)$ **Output:** s

1. $s = \sum_{i=0}^k \xi^i \cdot (f_i(\zeta_1) + r \cdot f_i(\zeta_2))$
-

We use the same 15-wires PLONK circuits that are designed for Mina.³

2.3 Elliptic Curve Arithmetic

2.3.1 Complete Addition and Doubling

Row	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
i	x_1	y_1	x_2	y_2	x_3	y_3	inv_{x_1}	inv_{x_2}	$\text{inv}_{x_2-x_1}$	δ	λ	\dots	\dots	\dots	\dots

Evaluations:

- $(x_3, y_3) = (x_1, y_1) + (x_2, y_2)$

³https://o1-labs.github.io/mina-book/specs/15_wires/15_wires.html

- b_i are bits of the k , first b_1 is the most significant bit of k , n is an accumulator of b_i .
- $(x_1, y_1) - (x_0, y_0) = (x_0, y_0) + (x_T, (2b_1 - 1)y_T)$
- $(x_2, y_2) - (x_1, y_1) = (x_1, y_1) + (x_T, (2b_1 - 1)y_T)$
- $(x_3, y_3) - (x_2, y_2) = (x_2, y_2) + (x_T, (2b_1 - 1)y_T)$
- $(x_4, y_4) - (x_3, y_3) = (x_3, y_3) + (x_T, (2b_1 - 1)y_T)$
- $(x_5, y_5) - (x_4, y_4) = (x_4, y_4) + (x_T, (2b_1 - 1)y_T)$
- $s_0 = \frac{y_0 - (2b_0 - 1) \cdot y_T}{x_0 - x_T}$
- $s_1 = \frac{y_1 - (2b_1 - 1) \cdot y_T}{x_1 - x_T}$
- $s_2 = \frac{y_2 - (2b_2 - 1) \cdot y_T}{x_2 - x_T}$
- $s_3 = \frac{y_3 - (2b_3 - 1) \cdot y_T}{x_3 - x_T}$
- $s_4 = \frac{y_4 - (2b_4 - 1) \cdot y_T}{x_4 - x_T}$
- $m = (n' - a_{-1}) \cdot (n' - a_0) \cdot (n' - a_1)$
- $t_0 = \text{inv}_m$
- $t_1 = \text{inv}(n' - a_{-1})$
- $t_2 = \text{inv}(n' - a_1)$
- (x, y) - is the circuit's result.

Constraints:

- $\text{next}(w_2) \cdot (\text{next}(w_2) - 1) = 0$
- $\text{next}(w_3) \cdot (\text{next}(w_3) - 1) = 0$
- $\text{next}(w_4) \cdot (\text{next}(w_4) - 1) = 0$
- $\text{next}(w_5) \cdot (\text{next}(w_5) - 1) = 0$
- $\text{next}(w_6) \cdot (\text{next}(w_6) - 1) = 0$
- $(w_2 - w_0) \cdot \text{next}(w_7) = w_3 - (2 \cdot \text{next}(w_2) - 1) \cdot w_1$
- $(w_7 - w_0) \cdot \text{next}(w_8) = w_8 - (2 \cdot \text{next}(w_3) - 1) \cdot w_1$
- $(w_9 - w_0) \cdot \text{next}(w_9) = w_{10} - (2 \cdot \text{next}(w_4) - 1) \cdot w_1$
- $(w_{11} - w_0) \cdot \text{next}(w_{10}) = w_{12} - (2 \cdot \text{next}(w_5) - 1) \cdot w_1$
- $(w_{13} - w_0) \cdot \text{next}(w_{11}) = w_{14} - (2 \cdot \text{next}(w_6) - 1) \cdot w_1$
- $(2 \cdot w_3 - \text{next}(w_7) \cdot (2 \cdot w_2 - \text{next}(w_7)^2 + w_0))^2 = (2 \cdot w_2 - \text{next}(w_7)^2 + w_0)^2 \cdot (w_7 - w_0 + \text{next}(w_7)^2)$
- $(2 \cdot w_8 - \text{next}(w_8) \cdot (2 \cdot w_7 - \text{next}(w_8)^2 + w_0))^2 = (2 \cdot w_7 - \text{next}(w_8)^2 + w_0)^2 \cdot (w_9 - w_0 + \text{next}(w_8)^2)$
- $(2 \cdot w_{10} - \text{next}(w_9) \cdot (2 \cdot w_9 - \text{next}(w_9)^2 + w_0))^2 = (2 \cdot w_9 - \text{next}(w_9)^2 + w_0)^2 \cdot (w_{11} - w_0 + \text{next}(w_9)^2)$
- $(2 \cdot w_{12} - \text{next}(w_{10}) \cdot (2 \cdot w_{11} - \text{next}(w_{10})^2 + w_0))^2 = (2 \cdot w_{11} - \text{next}(w_{10})^2 + w_0)^2 \cdot (w_{13} - w_0 + \text{next}(w_{10})^2)$
- $(2 \cdot w_{14} - \text{next}(w_{11}) \cdot (2 \cdot w_{13} - \text{next}(w_{11})^2 + w_0))^2 = (2 \cdot w_{13} - \text{next}(w_{11})^2 + w_0)^2 \cdot (\text{next}(w_0) - w_0 + \text{next}(w_{11})^2)$
- $(w_8 + w_3) \cdot (2 \cdot w_2 - \text{next}(w_7)^2 + w_0) = (w_2 - w_7) \cdot (2 \cdot w_3 - \text{next}(w_7) \cdot (2 \cdot w_2 - \text{next}(w_7)^2 + w_0))$
- $(w_{10} + w_8) \cdot (2 \cdot w_7 - \text{next}(w_8)^2 + w_0) = (w_7 - w_9) \cdot (2 \cdot w_8 - \text{next}(w_8) \cdot (2 \cdot w_7 - \text{next}(w_8)^2 + w_0))$
- $(w_{12} + w_{10}) \cdot (2 \cdot w_9 - \text{next}(w_9)^2 + w_0) = (w_9 - w_{11}) \cdot (2 \cdot w_{10} - \text{next}(w_9) \cdot (2 \cdot w_9 - \text{next}(w_9)^2 + w_0))$
- $(w_{14} + w_{12}) \cdot (2 \cdot w_{11} - \text{next}(w_{10})^2 + w_0) = (w_{11} - w_{13}) \cdot (2 \cdot w_{12} - \text{next}(w_{10}) \cdot (2 \cdot w_{11} - \text{next}(w_{10})^2 + w_0))$
- $(\text{next}(w_1) + w_{14}) \cdot (2 \cdot w_{13} - \text{next}(w_{11})^2 + w_0) = (w_{13} - \text{next}(w_0)) \cdot (2 \cdot w_{14} - \text{next}(w_{11}) \cdot (2 \cdot w_{13} - \text{next}(w_{11})^2 + w_0))$
- $w_5 = 32 \cdot (w_4) + 16 \cdot \text{next}(w_2) + 8 \cdot \text{next}(w_3) + 4 \cdot \text{next}(w_4) + 2 \cdot \text{next}(w_5) + \text{next}(w_6)$

Additional constraints for range check:

for rows $i, i + 2, \dots, i + 40$:

- $\text{next}(w_{12}) \cdot (\text{next}(w_{12}) - 1) \cdot (\text{next}(w_{12}) - 2) \cdot (\text{next}(w_{12}) - 3) \cdot (\text{next}(w_{12}) - 4) \cdot (\text{next}(w_{12}) - 5) \cdot (\text{next}(w_{12}) - 6) \cdot (\text{next}(w_{12}) - 7) = 0$
- $\text{next}(w_{13}) \cdot (\text{next}(w_{13}) - 1) \cdot (\text{next}(w_{13}) - 2) \cdot (\text{next}(w_{13}) - 3) \cdot (\text{next}(w_{13}) - 4) \cdot (\text{next}(w_{13}) - 5) \cdot (\text{next}(w_{13}) - 6) \cdot (\text{next}(w_{13}) - 7) = 0$
- $\text{next}(w_{14}) = 2^6 \cdot w_6 + 2^3 \cdot \text{next}(w_{12}) + \text{next}(w_{13})$

for row $i + 42$:

- $\text{next}(w_{12}) \cdot (\text{next}(w_{12}) - 1) \cdot (\text{next}(w_{12}) - 2) \cdot (\text{next}(w_{12}) - 3) \cdot (\text{next}(w_{12}) - 4) \cdot (\text{next}(w_{12}) - 5) \cdot (\text{next}(w_{12}) - 6) \cdot (\text{next}(w_{12}) - 7) = 0$

- $\text{next}(w_{13}) \cdot (\text{next}(w_{13}) - 1) = 0$
- $\text{next}(w_{14}) = 2^4 \cdot w_6 + 2 \cdot \text{next}(w_{12}) + \text{next}(w_{13})$

for row $i + 44$:

- $\text{next}(w_{12}) \cdot (w_6 - \text{prev}(w_{14})) = 0$

for row $i + 46$:

- $\text{prev}(w_{12}) \cdot (2 \cdot \text{prev}(w_{14}) + \text{prev}(w_{13}) - 2^{123}) = 0$

Constraints for the last 3 rows:

- $w_2 \cdot (w_2 - 1) = 0$
- $w_3 \cdot (w_3 - 1) = 0$
- $w_4 \cdot (w_4 - 1) = 0$
- $w_5 \cdot (w_5 - 1) = 0$
- $w_6 \cdot (w_6 - 1) = 0$

- $\left((\text{prev}(w_{14}) + \text{prev}(w_{12})) \cdot (2 \cdot \text{prev}(w_{11}) - (w_{10})^2 + \text{prev}(w_0)) - ((\text{prev}(w_{11}) - \text{prev}(w_{13})) \cdot (2 \cdot \text{prev}(w_{12}) - w_{10} \cdot (2 \cdot \text{prev}(w_{11}) - (w_{10})^2 + \text{prev}(w_0)))) \right) \cdot (\text{next}(w_8) \cdot \text{next}(w_2)) = 0$
- $\left(((w_1 + \text{prev}(w_{14})) \cdot (2 \cdot \text{prev}(w_{13}) - (w_{11})^2 + \text{prev}(w_0))) - ((\text{prev}(w_{13}) - w_0) \cdot (2 \cdot \text{prev}(w_{14}) - w_{11} \cdot (2 \cdot \text{prev}(w_{13}) - (w_{11})^2 + \text{prev}(w_0)))) \right) \cdot (\text{next}(w_8) \cdot \text{next}(w_2)) = 0$
- $\text{prev}(w_5) = 32 \cdot \text{prev}(w_4) + 16 \cdot w_2 + 8 \cdot w_3 + 4 \cdot w_4 + 2 \cdot w_5 + w_6$
- $(\text{next}(w_8) \cdot \text{next}(w_2) - 1) \cdot \text{next}(w_8)$
- $((\text{next}(w_5) - a_{-1}) \cdot \text{next}(w_3) - 1) \cdot (\text{next}(w_5) - a_{-1}) = 0$
- $((\text{next}(w_5) - a_1) \cdot \text{next}(w_4) - 1) \cdot (\text{next}(w_5) - a_1)$
- $(\text{next}(w_8) \cdot \text{next}(w_2) \cdot w_0) + ((\text{next}(w_5) - a_{-1}) \cdot \text{next}(w_3) - (\text{next}(w_5) - a_1) \cdot \text{next}(w_4)) \cdot ((\text{next}(w_5) - a_{-1}) \cdot \text{next}(w_3) - (\text{next}(w_5) - a_1) \cdot \text{next}(w_4)) \cdot \text{next}(w_6) - \text{next}(w_0) = 0$

- $(\text{next}(w_8) \cdot \text{next}(w_2) \cdot w_1) + ((\text{next}(w_5) - a_{-1}) \cdot \text{next}(w_3) - (\text{next}(w_5) - a_1) \cdot \text{next}(w_4)) \cdot \text{next}(w_7) - \text{next}(w_1) = 0$
- $\text{next}(w_8) - ((\text{next}(w_5) - a_{-1}) \cdot (\text{next}(w_5) - a_0) \cdot (\text{next}(w_5) - a_1))$

Copy constraints:

- (x_T, y_T) in row j are copy constrained with (x_T, y_T) in row $j + 2$ (for $j \in \{i, i + 2, i + 4, \dots, i + 98\}$) and with last row.
- (x_0, y_0) in row i are copy constrained with values from the first doubling circuit
- (x_0, y_0) in row $j, j \neq i$ are copy constrained with (x_5, y_5) in row $j - 1$
- $n = 0$ in row i is copy-constrained with the zero value
- n in the row $j, j \neq i$ is copy constrained with n' in the row $j - 2$
- n' in the row $i + 102$ is copy constrained with n' in the row $i + 100$
- k is copy constrained with n' in the row $i + 100$
- $u' = 0$ in row i is copy-constrained with the zero value
- u' in the row $j, i < j \leq i + 42$ is copy constrained with u'' in the row $j - 1$
- u is copy constrained with u' in the row $i + 44$
- b_0 in row $i + 1$ is copy-constrained with w_{12} in row $i + 45$
- b_0 in row $i + 53$ is copy-constrained with w_{13} in row $i + 45$
- w_5 in row $i + 50$ is copy-constrained with w_{14} in row $i + 45$.

2.3.3 Variable Base Endo-Scalar Multiplication

For $R = [b]T$, where $b = [b_n \dots b_0]$ and $b_i \in \{0, 1\}$:⁵

1. $P = [2](\phi(T) + T)$
2. for i from $\frac{\lambda}{2} - 1$ to 0:
 - 2.1 $Q = r_{2i+1} ? \phi([2r_{2i} - 1]T) : [2r_{2i} - 1]T$
 - 2.2 $R - P = P + Q$

The first step of the algorithm are verified by the doubling and unified addition circuit.

Row	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
i	x_T	y_T	--	--	x_P	y_P	$n = 0$	x_R	y_R	s_1	s_3	b_1	b_2	b_3	b_4
\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots
$i + 63$	x_T	y_T	--	--	x_P	y_P	n	x_R	y_R	s_1	s_3	b_1	b_2	b_3	b_4
$i + 64$	--	--	--	--	x_P	y_P	n	--	--	--	--	--	--	--	--

Evaluations:

- The first x_P, y_P are equal to $2 \cdot ((x_T, y_T) + ((\text{endo}) \cdot x_T, y_T))$
- b_i are bits of the k , first b_1 is the most significant bit of k , n is an accumulator of b_i .
- $(x_R, y_R) - (x_P, y_P) = (x_P, y_P) + (1 + (\text{endo} - 1) \cdot b_2)x_T, (2b_1 - 1)y_T$
- $(\text{next}(x_P), \text{next}(y_P)) - (x_R, y_R) = (x_R, y_R) + ((\text{endo} - 1) \cdot b_2)x_T, (2b_1 - 1)y_T$
- $s_1 = \frac{(2b_1 - 1) \cdot y_T - y_P}{(1 + (\text{endo} - 1) \cdot b_2)x_T - x_P}$
- $s_3 = \frac{(2b_1 - 1) \cdot y_T - y_R}{(1 + (\text{endo} - 1) \cdot b_2)x_T - x_R}$

Constraints:

- $w_{11} \cdot (w_{11} - 1) = 0$
- $w_{12} \cdot (w_{12} - 1) = 0$
- $w_{13} \cdot (w_{13} - 1) = 0$
- $w_{14} \cdot (w_{14} - 1) = 0$
- $((1 + (\text{endo} - 1) \cdot w_{12}) \cdot w_0 - w_4) \cdot w_9 = (2 \cdot w_{11} - 1) \cdot w_1 - w_5$
- $(2 \cdot w_4 - w_9^2 + (1 + (\text{endo} - 1) \cdot w_{12}) \cdot w_0) \cdot ((w_4 - w_7) \cdot w_9 + w_8 + w_5) = (w_4 - w_7) \cdot 2 \cdot w_5$

⁵Using the results from <https://eprint.iacr.org/2019/1021.pdf>

- $(w_8 + w_5)^2 = (w_4 - w_7)^2 \cdot (w_9^2 - (1 + (\text{endo} - 1) \cdot w_{12}) \cdot w_0 + w_7)$
- $((1 + (\text{endo} - 1) \cdot w_{12}) \cdot w_0 - w_7) \cdot w_{10} = (2 \cdot w_{13} - 1) \cdot w_1 - w_8$
- $(2 \cdot w_7 - w_{10}^2 + (1 + (\text{endo} - 1) \cdot w_{14}) \cdot w_0) \cdot ((w_7 - \text{next}(w_4)) \cdot w_{10} + \text{next}(w_5) + w_8) = (w_7 - \text{next}(w_4)) \cdot 2 \cdot w_8$
- $(\text{next}(w_4) + w_8)^2 = (w_7 - \text{next}(w_4))^2 \cdot (w_{10}^2 - (1 + (\text{endo} - 1) \cdot w_{14}) \cdot w_0 + \text{next}(w_4))$
- $\text{next}(w_6) = 16 \cdot w_6 + 8 \cdot w_{11} + 4 \cdot w_{12} + 2 \cdot w_{13} + w_{14}$

Copy constraints:

- (x_T, y_T) in row j are copy constrained with (x_T, y_T) in row $j + 1$
- (x_P, y_P) in row i are copy constrained with values from the first doubling circuit

2.4 Multi-Scalar Multiplication Circuit

Input: $G_0, \dots, G_{k-1} \in \mathbb{G}, s_0, \dots, s_{k-1} \in \mathbb{F}_r$, where \mathbb{F}_r is scalar field of \mathbb{G} .

Output: $S = \sum_{i=0}^k s_i \cdot G_i$

Using endomorphism:

1. $A = \infty$
2. for j from 0 to $k - 1$:
 - 2.1 $r := s_j, T := G_j$
 - 2.2 $S = [2](\phi(T) + T)$
 - 2.3 for i from $\frac{\lambda}{2} - 1$ to 0:
 - 2.3.1 $Q = r_{2i+1} ? \phi([2r_{2i} - 1]T) : [2r_{2i} - 1]T$
 - 2.3.2 $R = S + Q$
 - 2.3.3 $S = R + S$
 - 2.4 $A = A + S$

$$\text{rows} \approx k \cdot (\text{sm_rows} + 1 + 2) \approx 67k,$$

where **sm_rows** is the number of rows in the scalar multiplication circuit.

Without endomorphism:

1. $A = \infty$
2. for j from 0 to $k - 1$:
 - 2.1 $r := s_j, T := G_j$
 - 2.2 $S = [2]T$
 - 2.3 for i from $n - 1$ to 0:
 - 2.3.1 $Q = k_{i+1} ? T : -T$
 - 2.3.2 $R = S + Q$
 - 2.3.3 $S = R + S$
 - 2.4 $A = A + S$

$$\text{rows} \approx k \cdot (\text{sm_rows} + 1 + 1) \approx 105k,$$

where **sm_rows** is the number of rows in the scalar multiplication circuit.

2.5 Poseidon Circuit

Mina uses Poseidon hash with width = 3. Therefore, each permutation state is represented by 3 elements and each row contains 5 states.

Denote i -th permutation state by $T_i = (T_{i,0}, T_{i,1}, T_{i,2})$.

Row	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
i	$T_{0,0}$	$T_{0,1}$	$T_{0,2}$	$T_{1,0}$	$T_{1,1}$	$T_{1,2}$	$T_{2,0}$	$T_{2,1}$	$T_{2,2}$	$T_{3,0}$	$T_{3,1}$	$T_{3,2}$	$T_{4,0}$	$T_{4,1}$	$T_{4,2}$
\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots
$i + 10$	$T_{50,0}$	$T_{50,1}$	$T_{50,2}$	$T_{51,0}$	$T_{51,1}$	$T_{51,2}$	$T_{52,0}$	$T_{52,1}$	$T_{52,2}$	$T_{53,0}$	$T_{53,1}$	$T_{53,2}$	$T_{54,0}$	$T_{54,1}$	$T_{54,2}$
$i + 11$	$T_{55,0}$	$T_{55,1}$	$T_{55,2}$	\dots	\dots	\dots	\dots	\dots	\dots	\dots	\dots	\dots	\dots	\dots	\dots

State change constraints:

$$\text{STATE}(i + 1) = \text{STATE}(i)^\alpha \cdot \text{MDS} + \text{RC}$$

Denote the index of the first state in the row by **start** (e.g. **start** = 50 for 10-th row). We can expand the previous formula to:

- For i from **start** to **start** + 5:
 - $T_{i+1,0} = T_{i,0}^7 \cdot \text{MDS}[0][0] + T_{i,1}^7 \cdot \text{MDS}[0][1] + T_{i,2}^7 \cdot \text{MDS}[0][2] + \text{RC}_{i+1,0}$
 - $T_{i+1,1} = T_{i,0}^7 \cdot \text{MDS}[1][0] + T_{i,1}^7 \cdot \text{MDS}[1][1] + T_{i,2}^7 \cdot \text{MDS}[1][2] + \text{RC}_{i+1,1}$
 - $T_{i+1,2} = T_{i,0}^7 \cdot \text{MDS}[2][0] + T_{i,1}^7 \cdot \text{MDS}[2][1] + T_{i,2}^7 \cdot \text{MDS}[2][2] + \text{RC}_{i+1,2}$

Notice that the constraints above include the state from the next row (**start** + 5).

2.6 Other Circuits

2.6.1 Endo-Scalar Computation

Let α be equals to $\phi(b)$, where $b \in 0, 1^\lambda$.

Row	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
i	n_0	n_8	a_0	b_0	a_8	b_8	—	x_0	x_1	x_2	x_3	x_4	x_5	x_6	x_7
\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots	\vdots
$i + 7$	n_0	n_8	a_0	b_0	a_8	b_8	res	x_0	x_1	x_2	x_3	x_4	x_5	x_6	x_7

Evaluations:

- In the first row $n_0 = 0$, $a_0 = 2$, $b_0 = 2$.
- x_i are 2-bits chunks of the b , first x_0 is the most significant bit of b , n is an accumulator of x_i .
- The values (a_8, b_8) are 8 iterations of the following computations:

$$(a_i, b_i) = (2 \cdot a_{i-1} + c_f(x_{i-1}), 2 \cdot b_{i-1} + d_f(x_{i-1})), \text{ where } c_f(x) = 2/3 \cdot x^3 - 5/2 \cdot x^2 + 11/6 \cdot x \text{ and } d_f(x) = 2/3 \cdot x^3 - 7/2 \cdot x^2 + 29/6 \cdot x - 1.$$

Constraints:

- $w_7 \cdot (w_7 - 1) \cdot (w_7 - 2) \cdot (w_7 - 3) = 0$
- $w_8 \cdot (w_8 - 1) \cdot (w_8 - 2) \cdot (w_8 - 3) = 0$
- $w_9 \cdot (w_9 - 1) \cdot (w_9 - 2) \cdot (w_9 - 3) = 0$
- $w_{10} \cdot (w_{10} - 1) \cdot (w_{10} - 2) \cdot (w_{10} - 3) = 0$
- $w_{11} \cdot (w_{11} - 1) \cdot (w_{11} - 2) \cdot (w_{11} - 3) = 0$
- $w_{12} \cdot (w_{12} - 1) \cdot (w_{12} - 2) \cdot (w_{12} - 3) = 0$
- $w_{13} \cdot (w_{13} - 1) \cdot (w_{13} - 2) \cdot (w_{13} - 3) = 0$
- $w_{14} \cdot (w_{14} - 1) \cdot (w_{14} - 2) \cdot (w_{14} - 3) = 0$

- $w_4 = 256 \cdot w_2 + 128 \cdot c_f(w_7) + 64 \cdot c_f(w_8) + 32 \cdot c_f(w_9) + 16 \cdot c_f(w_{10}) + 8 \cdot c_f(w_{11}) + 4 \cdot c_f(w_{12}) + 2 \cdot c_f(w_{13}) + c_f(w_{14})$
- $w_5 = 256 \cdot w_3 + 128 \cdot d_f(w_7) + 64 \cdot d_f(w_8) + 32 \cdot d_f(w_9) + 16 \cdot d_f(w_{10}) + 8 \cdot d_f(w_{11}) + 4 \cdot d_f(w_{12}) + 2 \cdot d_f(w_{13}) + d_f(w_{14})$
- $w_1 = 2^{16} \cdot w_0 + 2^{14} \cdot w_7 + 2^{12} \cdot w_8 + 2^{10} \cdot w_9 + 2^8 \cdot w_{10} + 2^6 \cdot w_{11} + 2^4 \cdot w_{12} + 2^2 \cdot w_{13} + w_{14}$
- for $i + 7$:
 1. $w_6 = \mathbf{endo} \cdot w_4 + w_5$

Copy constraints:

- n_0, a_0, b_0 in row $j + 1$ are copy constrained with (n_8, a_8, b_8) in row j

2.7 Proof Verification Component

Let \mathbf{G} be a group of points on the elliptic curve $E(\mathbb{F}_p)$, $|\mathbf{G}| = r$.

Kimchi verification procedure includes operations over two groups: \mathbf{G} and scalars of \mathbf{G} . Thus, the verification circuit has to handle operations over two fields: \mathbb{F}_p and \mathbb{F}_r . This could be achieved either with non-native arithmetic circuits⁶ or via splitting the verification into two proofs over different fields. Here we use the second option.

⁶For instance, see <https://www.plonk.cafe/t/non-native-field-arithmetic-with-turboplonek-plookup-etc/90>

1. for each π_i :
 - 1.1 **random_oracle**(p_{comm}, π_i):

 - 5.9 $\text{scalars}[i+1] = \text{scalars}[i+1] + \sum_j (s_j \cdot r'_i)$ for s_j from h_i coefficients
 - 5.10 $\text{scalars}[0] = \text{scalars}[0] - r_i \cdot o_{\pi_i}.z2$
 - 5.11 $\text{scalars} = \text{scalars} \parallel [-r_i \cdot o_{\pi_i}.z1 \cdot b_i]$
 - 5.12 for each challenge (ξ, ξ^{-1}) from opening challenges:
 - 5.12.1 $\text{scalars} = \text{scalars} \parallel [r_i \cdot c_i \cdot \xi^{-1}]$
 - 5.12.2 $\text{scalars} = \text{scalars} \parallel [r_i \cdot c_i \cdot \xi]$
 - 5.13 $u_acc = 1$
 - 5.14 for each commitment part from evaluations:
 - 5.14.1 $\text{scalars} = \text{scalars} \parallel [r_i \cdot c_i \cdot u_acc]$
 - 5.14.2 $u_acc = u_acc \cdot u_i$
 - 5.15 $\text{scalars} = \text{scalars} \parallel [r_i \cdot c_i \cdot \text{cip}_i]$
 - 5.16 $\text{scalars} = \text{scalars} \parallel [r_i]$
 - 5.17 $r_{i+1} = r_i \cdot \rho_1$
 - 5.18 $r'_{i+1} = r'_i \cdot \rho_2$
-

Algorithm 7 Batch Verify - Base Field

Input: $\pi_0, \dots, \pi_{\text{batch_size}}$, where $\pi_i = \{H_{i, \mathbb{F}_q}, \zeta_i, \zeta_i \omega, v_i, u_i, \mathbf{PE}_i, o_{\pi_i}\}$

Output: acc or rej

1. $\text{bases} = [pk.H, pk.G_0, \dots, pk.G_n, \mathcal{O}, \dots, \mathcal{O}]$
 2. for $0 \leq i < \text{batch_size}$:
 - 2.1 Get cip_i from PI
 - 2.2 $H_{i, \mathbb{F}_q}.\text{absorb}(cip_i - 2^{255})$
 - 2.3 $U_i = (H_{i, \mathbb{F}_q}.\text{squeeze}()).\text{to_group}()$
 - 2.4 $H_{i, \mathbb{F}_q}.\text{absorb}(o_{\pi_i}.\delta)$
 - 2.5 $\text{bases} = \text{bases} \parallel [o_{\pi_i}.sg]$
 - 2.6 $\text{bases} = \text{bases} \parallel [U_i]$
 - 2.7 for each opening (L, R) from opening.lr :
 - 2.7.1 $\text{bases} = \text{bases} \parallel [L]$
 - 2.7.2 $\text{bases} = \text{bases} \parallel [R]$
 - 2.8 for each commitment part comm_i from evaluations:
 - 2.8.1 $\text{bases} = \text{bases} \parallel [\text{comm}_i]$
 - 2.9 $\text{bases} = \text{bases} \parallel [U_i]$
 - 2.10 $\text{bases} = \text{bases} \parallel [o_{\pi_i}.\delta]$
 3. $\text{res} = \text{MSM}(\text{scalars}, \text{bases})$
 4. return $\text{res} == 0$
-

Algorithm 8 Combined Inner Product

Input: $\xi, r, f_0(\zeta_1), \dots, f_k(\zeta_1), f_0(\zeta_2), \dots, f_k(\zeta_2)$

Output: s

1. Fr: $s = \sum_{i=0}^k \xi^i \cdot (f_i(\zeta_1) + r \cdot f_i(\zeta_2))$
-

Chapter 3

In-EVM State Proof Verifier

This introduces a description for in-EVM Mina Protocol state proof verification mechanism. Crucial components which define this part design are:

1. Verification architecture description.
2. Verification logic API reference.
3. Input data structures description.

3.1 Verification Logic Architecture

The verification logic is split to several parts:

1. Verification Key Definition
2. LPC/FRI auxiliary proof deserialization

3.2 Verification Logic API Reference

3.3 Input Data Structures

Chapter 4

Appendix A. In-EVM Mina State

This introduces a description for in-EVM Mina Protocol state handling mechanism which is supposed to provide a bridge user with the way to verify plaintext transactions coming from Mina database commit log on EVM.

4.1 Overview

The protocol described literally replicates Mina's commit log construction protocol on EVM. The overall process description is as follows:

Algorithm 9 Commit Log Construction Overview

1. A user retrieves a replication packet B_n containing some transaction T from Mina's commit log.
 2. A user submits the replication packet B_n to the in-EVM piece of logic.
 3. The in-EVM piece of logic emplaces the replication packet B_n into the backwards-linked list C .
 4. The in-EVM piece of logic computes a Poseidon hash H_{B_n} of a replication packet B_n and inserts such one in a Merkle Tree T .
 5. The in-EVM piece of logic uses a Merkle Tree's hash H_{B_n} of a particular replication packet B_n as an input to the state proof verification mechanism, taking the state proof from the original Mina's cluster in the same time, corresponding to the replication packet B_n sequo.
 6. In case the verification of a state proof corresponding to the replication packet B_n was completed successfully, such a replication packet B_n can be considered valid and appended to the backwards-linked list, representing in-EVM Mina's commit log.
 7. In case the verification of a state proof corresponding to the replication packet B_n wasn't completed successfully, then a replication packet B_n gets rejected by the in-EVM piece of logic.
 8. In case there are more than a single replication packet B_n (e.g. B_{n_1} and B_{n_2}) and each of them is being considered valid, the backward-linked list used to store such replication packets turns into the tree containing several branches of backward-linked lists C_1, \dots, C_M .
 9. In case several branches C_1, \dots, C_M are introduced, the Mina's Ouroboros modification chain selection rule applies to pick the same branch the original Mina's cluster chain selection rule picked.
-

T_{n_1, n_2} allows to provide a successful transaction from $\{B_{n_1}, \dots, B_{n_2}\}$ to the Ethereum-based proof verifier later.

Ouroboros' consensus protocol chain selection rule which is supposed to handle potentially incorrect replication packet data submitted by the user (and to keep the in-EVM commit log consistent with the actual Mina's one) is defined as follows:

Here, C_{loc} is the local commit log sequence, $N = C_1, \dots, C_M$ is the list of potential commit log sequences to choose from. The function $getMinDen(C)$ outputs the minimum of all the window densities observed thus far in C .

Algorithm 10 getMinDen(C)

Let B_{last} be the last block in C .

1. if $B_{last} = G$ then // i.e., if B_{last} is the genesis block
 2. return 0
 3. else
 4. Parse B_{last} to obtain the parameter $minDen$.
 5. return $minDen$
-

The function $isShortRange(C, C')$ outputs whether or not the chains fork in the “short range” or not.

Algorithm 11 isShortRange($C1, C2$)

1. Let $prevLockcp$ and $prevLockcp$ be the $prevLockcp$ components in the 12 last blocks of $C1, C2$, respectively.
 2. if $prevLockcp = prevLockcp$ then
 3. return \top
 4. else
 5. return \perp
-

Algorithm 12 maxvalid-sc($C_{loc}, N = C_1, \dots, C_M, k$)

1. Set $C_{max} \Leftarrow C_{loc}$ // Compare C_{loc} with each candidate chain in N
 2. for $i = 1, \dots, M$ do if $isShortRange(C_i, C_{max})$ then // Short-range fork
if $|C_i| > |C_{max}|$ then
Set $C_{max} \Leftarrow C_i$
end if
else //Long-range fork
if $getMinDen(C_i) > getMinDen(C_{max})$ then
Set $C_{max} \Leftarrow C_i$
end if
end if
end for
 3. return C_{max}
-

4.1.1 Purpose

The protocol is supposed to make it possible for the users to prove a particular transaction to the in-EVM Mina’s commit log replica to be able to prove it actually belongs to Mina’s commit log.

The overview of such a mechanism is as follows:

Algorithm 13 Transaction Plaintext Data Proving Approach

1. A user retrieves the transaction T from Mina's database commit log
 2. A user compares the transaction T with the contents of the in-EVM Mina's commit log representation.
 3. If a trivial comparison results in a match, Mina's data from the transaction T can be considered valid for the in-EVM usage.
 4. Otherwise, the transaction is supposed to be rejected.
-
